AHLI SWITZLER | CASE STUDY 4

A Four-Agent AI Pipeline for Music Press Outreach

I built a Python pipeline of four AI agents that finds and pitches music press for an EP release, with a final agent that rewrites every pitch to sound like a person sent it.

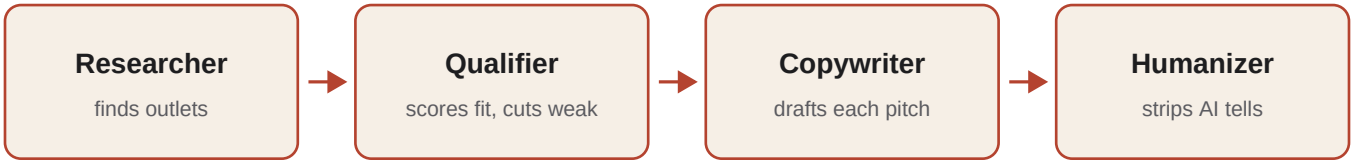
THE CHALLENGE

Promoting an indie-pop EP means pitching a long list of playlist curators, blogs, and press outlets. Done by hand, research and personalization eat the time. Done by a single AI prompt, the pitches come out generic and easy to ignore.

ROLE AND TOOLS

Solo. Python, built with Claude Code.

HOW THE AGENTS CONNECT



THE PROCESS

Each agent does one job and hands its output to the next.

1. Researcher finds curators, blogs, and outlets covering music in the EP's lane.
2. Qualifier scores each target on fit and drops the weak ones before any writing happens.
3. Copywriter drafts a pitch tailored to each target.
4. Humanizer rewrites each draft against a reference guide of AI writing patterns, stripping the tells before anything goes out.

WHAT I CAUGHT AND DECIDED

- Splitting the work across four agents made each step easier to check and fix than one large prompt would be.
- Putting qualification before copywriting means no effort goes into pitching outlets that were never a fit.
- I set hard rules on how the artist is described, so every pitch represents the release and its rights correctly.

THE RESULT

A working outreach system that turns a target list into personalized, human-sounding pitches. The same structure applies to any campaign that needs targeted outreach at volume, including B2B prospecting.
